Marketing Funnel & Conversion Performance — Key Findings & Recommendations

Finding 1 — Overall Funnel Performance

Out of 41,188 customers contacted, only 4,640 converted to a term deposit subscription, giving an overall conversion rate of 11.27% and a drop-off rate of 88.73%.

Recommendation: The business needs to improve lead quality by targeting customers who match the profile of previous converters rather than broad cold outreach.

Finding 2 — Contact Method Impact

Cellular contact converts at 14.74% compared to just 5.23% for telephone nearly three times higher.

Recommendation: Reallocate campaign budget towards cellular outreach and reduce telephone-based contacts to improve overall conversion efficiency and reduce cost per acquisition.

Finding 3 — Monthly Campaign Patterns

March, December, September and October have the highest conversion rates (43-50%) despite low contact volumes. May has the highest contact volume but the lowest conversion rate at 6.43%.

Recommendation: Shift campaign activity towards Q4 months and reduce May campaign spending. Quality of timing matters more than volume of contacts.

Finding 4 — Job Type Performance

Students convert at 31.43% and retired customers at 25.23% both significantly above the 11.27% average. Blue-collar workers convert at only 6.89% despite being the second largest group contacted.

Recommendation: Prioritise outreach to student and retired segments. Reduce investment in blue-collar outreach and redirect those resources to higher-converting segments.

Finding 5 — Contact Frequency Effect

First contact converts at 13.04%. Conversion drops consistently with each additional call, falling to 4.25% by the 8th contact attempt.

Recommendation: Set a maximum of 3 contact attempts per customer. After 3 failed attempts, remove the customer from the active campaign and replace with a fresh lead to improve efficiency and reduce customer frustration.
